TTControl | MATCH Hardware and Software Packages

For the development of
mobile machines ready for the future

It's a MATCH: Intelligent Hardware and Innovative Software in One Package

HYDAC Software and TTControl have extended the product range for the development of mobile machines with combined hardware and software packages.

Save up to 50 % development time

Our hardware and software packages allow you to develop extremely reliable and functionally safe electronic control systems, quickly and cost-effectively. The packages fit perfectly to each other. This enables efficient implementation of safety-relevant applications for complex vehicle and machine control systems – in line with the V-model and in up to 50 % less time.

Your advantage: the combined expertise of two strong partners

In a joint venture since 2008, TTControl has been complementing the HYDAC Group's portfolio with a pioneering range of mobile control systems and HMI's.

HYDAC has been developing innovative software solutions for mobile machines since 2010. Our core product is MATCH, a holistic software platform for mobile automation. Founded in 2017, HYDAC Software GmbH is continuously expanding its range of software solutions.

MATCH Software Tools

The versatile and perfectly coordinated tools in the MATCH tool chain supply tailor-made solutions throughout the machine's entire life cycle. The software tools are an integral part of the packages and can be used individually or as a complete package, depending on requirements.

P D T

The Project Definition Tool (PDT) supports the development, documentation, testing and production of embedded software applications for controllers and displays in complex vehicles and machines. Tested and certified toolboxes significantly simplify and accelerate application development.

M S T

The Machine Service Tool (MST) supports the machine configuration and maintenance of the software applications developed using MATCH. The software tool can be used over the machine's entire life cycle.

T S E

The Test and Simulation Environment (TSE) supports all test levels based on the V-model. It enables module tests, integration tests, system tests and application tests.

MATCH Hardware

All in one

MATCH Hardware provides you with the optimum system electronics solution for your specific machine project: the perfectly matched embedded software is supplied with every piece of hardware.

There are six modular software packages that build upon each other. Each software package covers different levels of complexity and work tasks.

The main highlight: each software package can be extended with additional software tools and/or further add-ons for the tools – allowing you to cover all your machine control's specific requirements with pinpoint accuracy.

Our tip for getting started: the MATCH Explorer package. When you purchase the controller hardware, we supply the basic licence for functional safe software development with MATCH free of charge.

<div>MATCH Hardware</div> <div>+</div> <div>Software packages</div>	Controllers	I/O modules	Connectivity	Displays
 MATCH Explorer	✓		or ✓	or ✓

 MATCH Ultimate	✓ ✓ + ✓ ✓ + ✓ ✓ + ✓ ✓			
 MATCH Display & Connectivity			✓ ✓ + ✓ ✓	
 MATCH Testing	✓ ✓ + ✓ ✓			

- ✓ Only one of these components can be integrated into a project
- ✓ ✓ Two or more components can be integrated into a project

MATCH Hardware Components at a Glance

Controllers

TTC 30 family | TTC 50 family

Freely programmable family of controllers for cost-optimised applications

TTC 500 family

High-performance safety control systems for high-end applications

TTC 2000 series

High-performance safety control systems which use the latest multi-core processor technology

I/O modules (IOM)

TTC 30XSH

CANopen-based and safety-certified, robust I/O module with flexible configuration of inputs and outputs

HSW J1939 IOM

J1939-based safety-certified I/O module with integrated error handling and flexible configuration of inputs and outputs

TTC 48XS

CANopen-based and safety-certified, robust I/O module with flexible configuration of inputs and outputs

Connectivity

TTConnect Wave

Connectivity solution for accessing your machines remotely

Fusion

State-of-the-art multi-interface edge computing platform with high computing power and multi-monitor control, equipped with an AI accelerator

TTConnect Cloud

Plug-and-play solution for monitoring and managing fleets and vehicles

Displays

Vision 305

Robust and compact 5" display with an excellent price-performance ratio

Vision 307

Robust 7" touchscreen display with an integrated high-end Vision 3 display controller and solid protection for use in off-highway vehicles

Vision 312

Versatile 12" display, extremely robust, with high CPU performance and intuitive user interface

Camera

HVT 1000

High-performance Ethernet camera equipped with a latest generation image sensor and processor

Testing

Breakout box(es)

Breakout solutions for simple commissioning and rapid field diagnostics, for use with all controller families and all I/O modules

MATCH Software Packages

Precisely Tailored to the Hardware

MATCH Explorer

All of MATCH's advantages for programming individual hardware components on your machine

Do you plan on programming a controller, display or remote device and having it customised to your specific machine requirements? If so, **MATCH Explorer** allows you to enjoy all the benefits of the holistic MATCH software platform: from robust, TÜV-certified middleware and extensive library modules to integrated functional safety. The package is available for C, CODESYS® and Qt, depending on the hardware. Not to mention: **MATCH Explorer** is integrated free of charge when you purchase a MATCH hardware component.

At a glance

- Definition and configuration of the software project per hardware component
- Efficient programming at a high level of abstraction using MATCH middleware
- Simulating and debugging the embedded controller software on a PC
- Perfect application portability to other MATCH hardware components
- Configure CAN messages instead of programming them
- Controlling and reading out standard components such as directional valves and proportional valves, joysticks, sensors, switches etc.
- Servicing the controller: adjusting parameters, configurations, reading out error codes, vehicle states and diagnostic values
- Extensively configurable error management with numerous interfaces for achieving the requirements in the event of an error
- Simple process for updating MATCH software projects using the display or service tool

Controller

or

Display

or

Connectivity

...each as a single project

MATCH Standard

For programming all controllers connected in the machine network as part of a joint project

The **MATCH Standard** package builds on MATCH Explorer. This means that you have all the functionalities of the basic package at your disposal. Plus: **MATCH Standard** allows you to define your software project at a machine level and easily program all controllers connected to the machine's network, including the diagnostic connection. The package is available for C and CODESYS®, depending on the hardware. The Code Builder for MATLAB/Simulink® is available separately.

The MATCH Standard add-ons

- Manage several controllers in just one machine project
- Generate embedded code for all controllers in the machine network at the touch of a button
- Automated generation of documentation for projects and development
- Development service tool with comprehensive services from optimisation of prototypes up to commissioning at the end of production line
- Service interface with up to eight customisable access levels and user authentication
- Machine-specific fleet management

Controllers

...individually or in a network

MATCH Advanced

For the development of connected controller architectures with I/O module extensions within a complex machine network

MATCH Advanced extends the standard package. As well as giving you the opportunity to benefit from all the functionalities of MATCH Explorer and MATCH Standard.

It also enables you to set up complex applications with a large number of inputs and outputs and precisely configure all desired machine requirements within the network. The package is available for C and CODESYS®, depending on the hardware. The Code Builder for MATLAB/Simulink® is available separately.

The MATCH Advanced add-ons

- CANopen Safety Protocol Stack for functional safe connection of safety I/O modules
- J1939 Safety Protocol Stack for functional safe communication with the J1939 HYDAC Software I/O module
- Advanced Output & Signal Control toolboxes for extended functionality
- DMX Selected Services

MATCH Ultimate

For the implementation of networked vehicle architectures with controllers, displays, connectivity and I/O modules

MATCH Ultimate is an extension to MATCH Advanced, offering you all the options you need to create complex hardware architectures on your machine whilst complying with demanding safety and quality standards. Developers and testers benefit in several respects: **MATCH Ultimate** provides the necessary tools for all phases of development. All the steps build on each other perfectly. Users in the development process have access to the same database. The main highlight: the TSE is a dedicated tool for testing, allowing you to automatically test your machine project at all levels of the V-model.

The MATCH Ultimate add-ons

- One tool for the whole machine software
- Testing during development according to the V-model saves valuable time: unit-, module-, integration- and system-testing on machine level
- Extensive Qt libraries for displays and connectivity solutions in the machine network with controllers and I/O modules
- Service tool designer for customisable service pages
- Additional service tool for a second developer

...individually or as a complete networked system

MATCH Testing & Validation

For efficient controller software testing, including functional safety and documentation

MATCH Testing & Validation is geared towards testers' specific requirements. The software package allows quick plug-and-play implementation of all the test levels based on the V-model with integrated safety standards and consistent data. The test levels can easily be automated using scripts. In addition, the requirements, use cases and test cases are available directly in the scripts and are linked in a transparent way (traceable).

The advantages of MATCH Testing & Validation

- Simple creation, management and documentation of test projects, from individual controllers to large tests with multiple controllers
- Plug-and-play testing for all test levels based on the V-model: unit tests, module tests, integration tests and system tests
- Simple implementation of software tests on the virtual test bench
- Hybrid test approach: combination of virtual and physical controllers in a network
- Automated testing thanks to a test script interface
- Definition of test sequences according to the "Arrange – Act – Assert" principle
- Creation and use of custom diagnostic pages
- Additional service tool for a second tester
